# Transmission elements

The transmission elements in glass-fibre reinforced polyamide based technopolymer are an efficient alternative to metal transmission elements and can be used in all applications requiring noise reduction or the avoidance for the need of lubrication. The lightness of the technopolymer transmission elements allows their application in fields requiring a general weight reduction as well. Moreover, the technopolymer's high resistance to chemical agents limits corrosion in aggressive environments.

The steel gears are often oversized for the effective application they are used for: in this case, the technopolymer gears are an excellent solution and ensure a good mechanical resistance combined with an economical saving.

Application fields for technopolymer gears are various:

- Packaging and conveyor machines
- Industrial cleaning machines
- Glass and ceramic working machines
- Catering equipment
- Typographic industry
- Agricultural machines
- Chemical and pharmaceutical industry
- Household appliances

# Transmission elements

## Coupling

The technopolymer transmission elements can be paired with both technopolymer and metal gears. In the case of coupling with metal gears, the higher thermal conductivity of the metal allows a faster dissipation of the heat accumulated during the operation. In the case of metal-technopolymer coupling, the metal pinion and the technopolymer gear are the best option, as the wear of the technopolymer toothed gear is lower.

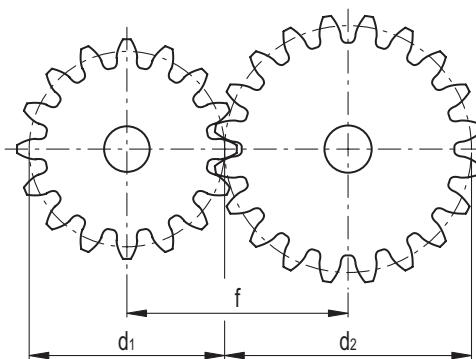

## Operating distance

In order to get an optimal meshing between two gears, it is necessary to have a positive backlash between the centers of the two shafts: the effective distance "f" between the two centers of the shafts on which the gears are mounted must be slightly longer than the distance  $(d_1+d_2)/2$ , where  $d_1$  and  $d_2$  are the pitch diameters of the two gears.

$$f = \frac{d_1+d_2}{2} + t$$

The meshing without backlash or with a negative backlash would increase the friction between the teeth, thus increasing the operating temperature and diminishing the resistance to wear and stress. To avoid these problems, for ELESA gears, the following tolerances "t" are recommended:

- $(+0.03 \text{ } +0.1)$  for modules 0.5 – 1.0 – 1.5
- $(+0.08 \text{ } +0.3)$  for bigger modules

## Lubrication

One of the main advantages of the reinforced technopolymer gears is the chance to use them without lubricating oil, thanks to the intrinsic nature of the polymers. Where possible, the use of lubrication is however recommended, to reduce friction and wear, thus increasing the service life of the product. For Elesa gears it is recommended to use lubricating grease based on lithium soaps and synthetic oil.

On equal use conditions, revolutions per minute and torque, the use of lubricants considerably increases the service life of the gears if compared with their operating in dry conditions.

## Machining

For a correct operation on the technopolymer spur gears, the mechanical machining has to be made by positioning the clamps on the teeth, as shown in the Fig.3. The diameter of the clamps must be turned by referring to the tip of the gear.

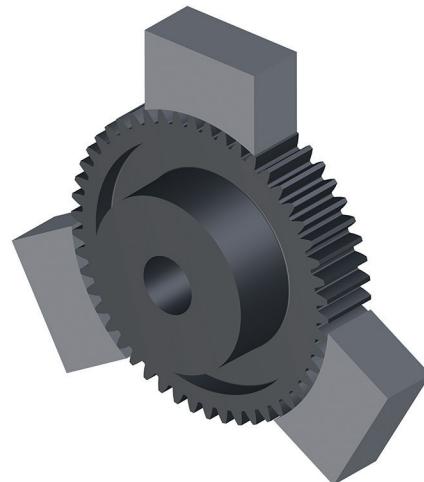

Fig.3: Gears machining

### Materials

ELESA spur gears and racks are made of glass-fibre reinforced polyamide based technopolymer. The main mechanical characteristics of this type of material are:

- High resistance to torsion and tensile strength (about three times higher than acetal resin)
- Good resistance to high temperatures
- Low friction coefficient, especially if compared to steel. Accordingly, the technopolymer gears can be used even when lubrication is not allowed
- Low specific weight, a greater lightness of technopolymer gears over metal gears
- High dimensional stability, high resistance to wear and chemical agents

### ZCL Spur gears

The maximum torques reported in the tables of the technical datasheet are a combination of theoretical calculations and experimental data obtained in the laboratory. The tests have been made in continuous operation and at a speed of 100-150 rpm without any lubrication, to test the worst possible conditions.

The torques in the tables provide a rough indication and cannot be considered valid for every possible application. The operating conditions (rpm, working temperatures, coupling with transmission elements made of different materials, lubricated or dry conditions, continuous or intermittent operation etc.) strongly influence the performance.

### ZCR Racks

Unlike the gears, the most important mechanical value for the racks is the maximum stress that can be applied on a single tooth. This is due to the fact that, on this particular transmission element, no torque is applied. The maximum stress values reported in the tables of the datasheet are the results of laboratory tests in which the force applied to the tooth increases until the tooth breaks.

The maximum stress values reported in the datasheet show the maximum stress that can be applied when a single tooth is meshed. An increase in the number of meshed teeth will not linearly increase the maximum applicable stress because only one tooth will ever work in optimal conditions.

**MATERIAL**

Glass-fibre reinforced polyamide-based (PA) technopolymer, grey colour.

**STANDARD EXECUTIONS**

- **ZCL-0.5:** module 0.5, not drilled hub (number of teeth  $Z \leq 50$ ) or plain pass-through hole (number of teeth  $Z \geq 55$ ).
- **ZCL-1.0:** module 1.0, not drilled hub (number of teeth  $Z = 10$ ) or plain pass-through hole.
- **ZCL-1.5:** module 1.5, plain pass-through hole.
- **ZCL-2.0:** module 2.0, plain pass-through hole.
- **ZCL-2.5:** module 2.5, plain pass-through hole.
- **ZCL-3.0:** module 3.0, plain pass-through hole.

In the execution with the plain pass-through hole, the size  $d$  in the tables represents the diameter of the minimum hole that can be obtained through machining.

**FEATURES**

The torques indicated in the tables are granted with rpm included between 0 and 150. Torque values can vary depending on lubrication, temperature, pairing with different materials and continuous operating hours.

**TECHNICAL DATA**

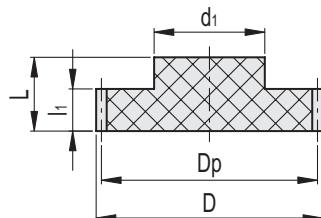

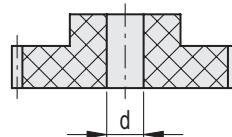

See: Transmission elements (on page 2).

**SPECIAL EXECUTIONS ON REQUEST**

- Assembly by means of a transversal grub screw.
- Hub with hole and keyway in compliance with DIN 6885/1 tolerance P9.
- Maximum tolerance on plain pass-through hole: IT 9.

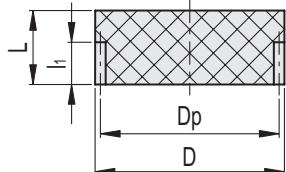

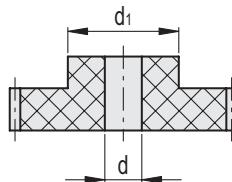

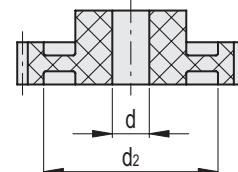

**MOUNTING**

To pair two spur gears, a positive backlash must be considered. For modules 0.5 – 1.0 – 1.5 is recommended the tolerance (+0,03 +0,1). For modules 2.0 – 2.5 – 3.0 is recommended the tolerance (+0,08 +0,3).

\* Pitch diameter.

## MATERIAL

Glass-fibre reinforced polyamide-based (PA) technopolymer, grey colour.

## STANDARD EXECUTIONS

- **ZCR**: square section racks.
- **ZCR-A**: square section racks with steel core.
- **ZCR-PL**: racks with mounting bracket for mounting on a plane parallel to teeth.
- **ZCR-PD**: racks with mounting bracket for mounting on a plane perpendicular to teeth.
- **ZCR-T**: "T" shape racks.

## FEATURES

The loads reported in the tables indicate the maximum load that can be applied on a single tooth.

The alignment between two or more racks is granted only for the execution ZCR-A with module 1.0 – 1.5 – 2.0 – 4.0.

## TECHNICAL DATA

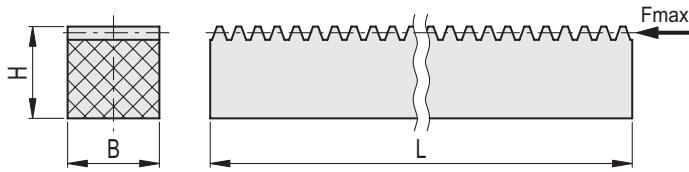

See: Transmission elements (on page 2).

## SPECIAL EXECUTIONS ON REQUEST

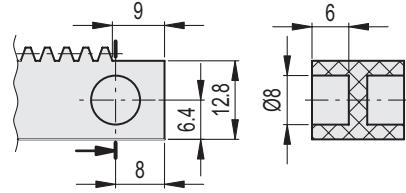

Special lengths on request. On special lengths the meshing is not granted in case of alignment.

**ZCR (M = 0.5)**

**ZCR (M = 1)**
